HEROIN AFFECTS YOUR BRAIN. Heroin, an illicit opioid, enters the brain quickly. It slows down the way you think, reaction time, and memory. Over the long term, heroin can change the brain in ways that lead to addiction.

HEROIN AFFECTS YOUR BODY. Heroin slows down your heartbeat and breathing, sometimes so much that it can be life-threatening. Heroin poses special problems for those who inject it because of the risks of HIV, hepatitis B and C, and other diseases that can occur from sharing needles.

HEROIN IS HIGHLY ADDICTIVE. Heroin enters the brain rapidly and causes a fast, intense high. Repeated heroin use increases the risk of developing an addiction; someone addicted to heroin will continue to seek and use the drug despite negative consequences.

HEROIN IS NOT WHAT IT MAY SEEM. Other substances are sometimes added to heroin. They clog blood vessels leading to the liver, lungs, kidneys, and brain and lead to inflammation or infection. Powder sold as heroin may also contain other dangerous chemicals, such as fentanyl, that increase the risk of fatal overdose.

HEROIN CAN KILL YOU. Heroin slows—and sometimes stops—breathing, which can result in death. In 2015, there were 2,343 overdose deaths related to heroin or other illicit opioids among people ages 15 to 24.

HEROIN ADDICTION IS TREATABLE. Medication, in combination with behavioral treatment, can help people stop using heroin and recover from addiction. Building a support system that helps people stop using heroin and other opioids is also important. Medications such as buprenorphine, methadone, and naloxone greatly increase the chance of recovery and reduce the risk of overdose. Friends and family members should have naloxone nearby if possible in case of overdose.

The information presented in this document should not be considered medical advice and is not a substitute for individualized patient or client care and treatment decisions.
KNOW THE LAW. Heroin is an illegal Schedule I drug, meaning that it is addictive and has no accepted medical use.14

GET THE FACTS. Any method of heroin use—snorting, smoking, swallowing, or injecting the drug—can cause immediate harm and lead to addiction or death.15

KNOW THE RISKS. Using heroin can change the brain, and the changes may not be easily reversed.16

LOOK AROUND YOU. The majority of teens are not using heroin. According to a 2015 national study, fewer than 1 out of 1,000 adolescents ages 12 to 17 were current heroin users.17

BEFORE YOU RISK IT!

HOW CAN YOU TELL IF A FRIEND IS USING HEROIN?

Signs and symptoms of heroin use are:18,19,20
- Euphoria
- Drowsiness
- Impaired mental functioning
- Slow movement and breathing
- Needle marks
- Boils

Signs of a heroin overdose include:
- Shallow breathing
- Extremely small pupils
- Clammy skin
- Bluish-colored nails and lips
- Convulsions
- Coma

The drug naloxone can save the life of someone overdosing on heroin. Naloxone can be administered by anyone witnessing an overdose or by first responders.

For more information on naloxone training and availability, visit www.drugabuse.gov/related-topics/naloxone.

WHAT CAN YOU DO TO HELP SOMEONE WHO IS USING HEROIN?

BE A FRIEND. SAVE A LIFE.

Encourage your friend to stop using or seek help from a parent, teacher, or other caring adult.
